

Wood Technology Inver College:

Wood Technology is a practical and creative subject that gives students the opportunity to design, make, and evaluate a wide range of wooden projects. Throughout the course, students learn essential woodworking skills while also developing problem-solving, planning, and design abilities. They work with a variety of tools, machines, and materials to bring their ideas to life, from simple introductory projects to more complex designs.

Students enjoy Wood Technology because it allows them to learn in a hands-on environment where they can see their progress and achievements through the projects they create. The subject helps build confidence, creativity, and independence, while also encouraging teamwork and safe working practices. It is particularly rewarding for students to complete a project they have designed and crafted themselves.

In lessons, students engage in a variety of practical activities including designing projects, learning traditional woodworking techniques, and using modern equipment in the workshop. We encourage creativity and innovation while maintaining a strong focus on safety and craftsmanship. Students also explore design processes, technical drawing, and project planning as part of their learning.

Wood Technology provides students with valuable life skills, practical experience, and an appreciation for design and craftsmanship that can support further study in subjects such as Construction Studies and DCG.
